DIRECTIONS FOR USE

It is important these nutrients are made available for the Spring and Autumn growth flushes. This is best achieved by applying in the 4 weeks prior. Depending on local conditions, Spring applications should be made from July to August, Autumn from December to January.

Dissolve the recommended quantities (as per label) and water evenly around the root zone. In citrus this is located away from the trunk - under the outer foliage, and is referred to as the 'dripline'.

Foliar spray can be used as a top dressing to provide fast action and quick relief. However, this is only a temporary solution and regular soil applications should be followed for better results.
